

Product sheet vario-plate slotted shims

Solid slotted shims of the vario-plate brand are U-shaped individual shims made of stainless steel. The shims are primarily used for vertical distance adjustment of motors, pumps, turbines, and generators in machine and system construction and maintenance.

Slotted shims of the vario-plate brand are equipped with a drilled tab (18 mm) and slightly open insertion slot that allows simple insertion and removal. The outer corners are round to a radius of 6 mm. Upon request, peel-plates are available with your logo imprinted on them.

Standard vario-plates are manufactured from stainless steel 1.4301 (AISI 304) and available in various sizes. Their thicknesses range from very thin foil (0.05 mm) to 2-mm-thick sheet.

Solid slotted shims of the vario-plate brand are available as individual shims or in assorted assembly sets immediately from stock.
