

Product data sheet single-plate shims

Shims made of solid sheet metal are used for vertical distance compensation, i.e. for shimming motors, pumps, turbines, etc. in mechanical and plant engineering as well as in maintenance.

single-plate brand shims feature a perforated tab for easy insertion and removal, as well as a rounded geometry. Shims are also available with your logo upon request.

Standard shims are available immediately from stock either as individual sheets or in assorted assembly sets. For easy transport to the place of use as well as clear and gentle storage we recommend assembly sets in the matching case
